

What is claimed is:

1.) A soap container apparatus for attachment to the male threaded stem of a valve of a faucet, said apparatus comprising:

5 a substantially rectangular base having an attachment end and a drainage end having a plurality of drainage holes;

a fixing element for attachment of the attachment end of said base to said valve at ridge fixing element, wherein the bar soap after being used and placed in said base will have the water and soap residue remaining on the bar of soap to be drained out of said base via said drainage holes and wherein said apparatus can be used to turn said faucet on or off via said valve.

10 2. The soap container apparatus of claim 1 wherein said fixing element comprises a round flat lid and a female thread that corresponds to the male threaded stem of the valve.

3. The soap container apparatus of claim 2 wherein said base further comprises a hinged lid that substantially encloses said base when said lid is closed onto to said base thereby protecting the bar of soap contained therein.
